1. Research Interests

My research interests lie in the area of computational solid mechanics with emphasis on the formulation of numerical methods and their implementation for computational modeling and simulation of engineering solids and structures, and for applications in real-time structural health monitoring. The formulation of these methods is developed based on numerical methods such as the finite element method, polygonal finite element methods, virtual element methods, generalized finite element methods and meshfree methods.

Recently, I have been involved in the development of computational libraries for the virtual element method (collaborative work with Dr. Alessandro Russo from Università di Milano-Bicocca), cell-based integration techniques for meshfree Galerkin methods using the virtual element framework (collaborative work with Dr. Alessandro Russo from Università di Milano-Bicocca and Dr. Natarajan Sukumar from University of California at Davis) and meshfree nodal integration schemes using the virtual element framework (collaborative work with Dr. Edoardo Artioli from University of Rome Tor Vergata and Dr. Natarajan Sukumar from University of California at Davis).

2. Teaching Interests

My primary teaching interests are closely related to my research activities, focusing on theoretical, computational and applied aspects of numerical methods at both undergraduate and graduate levels. I offer courses on these topics on a regular basis. My secondary teaching interests are related to my professional experience in mechanical and structural design. I offer a course on machine elements every semester.
